

UNIVERSITY OF SWAZILAND

203

FACULTY OF SCIENCE AND ENGINEERING

DEPARTMENT OF PHYSICS

SUPPLEMENTARY EXAMINATION: 2013/2014

TITLE OF PAPER: NUCLEAR PHYSICS

COURSE NUMBER: P442

TIME ALLOWED: THREE HOURS

INSTRUCTIONS:

- ANSWER ANY FOUR QUESTIONS.
- EACH QUESTION CARRIES 25 POINTS.
- POINTS FOR DIFFERENT SECTIONS ARE SHOWN IN THE RIGHT-HAND MARGIN.
- USE THE INFORMATION IN THE NEXT TWO PAGES WHEN NECESSARY.

THIS PAPER HAS 8 PAGES, INCLUDING THIS PAGE.

Useful Data:

$$1 \text{ unified mass unit } (u) = 1.6605 \times 10^{-27} \text{ kg} = 931.5 \text{ MeV}/c^2$$

$$\text{Planck's constant } h = 6.63 \times 10^{-34} \text{ Js}$$

$$\text{Boltzmann's constant } k = 1.38 \times 10^{-23} \text{ J/K}$$

$$\text{Avogadro's number } N_A = 6.022 \times 10^{23} \text{ mol}^{-1}$$

$$\text{Speed of light (vacuum) } c = 3.0 \times 10^8 \text{ m/s}$$

$$\text{electron mass } m_e = 9.11 \times 10^{-31} \text{ kg} = 5.4858 \times 10^{-4} u = 0.511 \text{ MeV}/c^2$$

$$\text{neutron mass } m_n = 1.6749 \times 10^{-27} \text{ kg} = 1.008665 u = 939.573 \text{ MeV}/c^2$$

$$\text{proton mass } m_p = 1.6726 \times 10^{-27} \text{ kg} = 1.0072765 u = 938.280 \text{ MeV}/c^2$$

$$1 \text{ year} = 3.156 \times 10^7 \text{ s}$$

$$\text{nuclear radius, } R \approx r_0 A^{1/3}, \text{ where } r_0 = 1.2 \text{ fm}$$

$$\text{Elementary charge, } e = 1.6021 \times 10^{-19} \text{ C}$$

$$\text{Electric constant, } \epsilon_0 = 8.854 \times 10^{-12} \text{ C}^2/\text{J} \cdot \text{m}$$

The table of nuclear properties is provided in the last page.

Nuclide	Z	A	Atomic mass (u)	I^π	Abundance or Half life
H	1	1	1.007825	1/2 ⁺	99.985%
He	2	4	4.002603	0 ⁺	99.99986%
Li	3	7	7.016003	3/2 ⁻	92.5%
Be	4	11	11.021658	1/2 ⁺	13.8 s (β^-)
B	5	11	11.009305	3/2 ⁻	80.2%
C	6	12	12.00000	0 ⁺	99.89%
N	7	15	15.00109	1/2 ⁻	0.366%

Ir	77	191	190.960584	3/2 ⁺	37.3%
Au	79	199	198.968254	3/2 ⁺	16.8%

205

Question 1: Fundamental Forces 206

- (a) Summarize the standard model of elementary particles. (9)
- (b) If the proton-electron model of the nucleus were valid, show that all neutral atoms would contain an even number of fermions. (6)
- (c) Give two examples of each:
 - i. Quarks (2)
 - ii. Leptons (2)
 - iii. Baryons (2)
 - iv. Mesons (2)
 - v. Unifying Theories (2)

(a) Describe the main features of the Rutherford scattering formula. (6)

(b) Show, classically, that when an incident particle of mass m scatters off a target of mass m_T , the velocities are related by (Note: Lab frame) (7)

$$v_T^2 \left(1 - \frac{m_T}{m} \right) = 2\vec{v}_f \cdot \vec{v}_T$$

where \vec{v}_T and \vec{v}_f are the final velocities of the target and incident particles, respectively.

(c) Use the above result to do the following:

i. Show that the scattering angle is less than 90° for a beam of deuterons (non-relativistic) elastically scattering off a hydrogen target. (4)

ii. Show that there is no limit on the scattering angle for a beam of protons scattering off deuterons. (4)

iii. What are the limits on the scattering angle for a non-relativistic beam of deuterons scattering off a deuteron target? (4)

(a) Show that the dipole moment $\vec{p} = \int_0^R r \rho(r) dr$ is zero for a nucleus. (6)

(b) Show that the mean-square charge radius of a uniformly charged sphere is $\langle r^2 \rangle = 3R^2/5$ (5)

(c) One way of probing nuclear sizes is determining the size of charged matter by means of electron scattering experiments. The experimentally measurable quantity is the the electric form factor $F(\vec{q}) = \int \exp(i\vec{q} \cdot \vec{r}) \rho(\vec{r}) d^3r$, which is the Fourier transform of the charge distribution.

i. Show that if the charge distribution is spherically symmetric, the the form factor is given by (6)

$$F(q^2) = \frac{4\pi}{q} \int \sin(qr) \rho(r) r dr.$$

ii. Compute the form factor for $\rho(r) = \rho_0$ for $r < R$ zero otherwise. (8)

- (a) An initial number $N_A(0)$ of nuclei A decay into daughter nuclei B , which is also radioactive. The respective decay probabilities are λ_A and λ_B . If $\lambda_B = 2\lambda_A$,
- Calculate the time (in terms of λ_A) when N_B is maximum. (6)
 - Calculate $N_B(max)$ in terms of $N_A(0)$. (4)
- (b) Given that the production rate of a radioactive nuclide is P nuclei per second, derive the formula $N(t) = \frac{P}{\lambda}(1 - \exp(-\lambda t))$ for the production of the nuclide. (λ is the decay constant) (7)
- (c) It is desired to determine the age of a wood timber used to construct an ancient shelter. A sample of the wood is analyzed for its ^{14}C content and gives 2.1 decays per minute. Another sample of the same size from a recently cut tree of the same type gives 5.3 decays per minute. What is the age of the sample? (Note: $t_{1/2} = 5730$ y) (8)

- (a) The maximum kinetic energy of the positron spectrum emitted in the decay of a $^{11}\text{C} \rightarrow ^{11}\text{B}$ is 1.983 MeV. Use this information and the known mass of ^{11}B to calculate the mass of ^{11}C . (6)
- (b) Supply the missing component(s) in the following processes:
- i. $^6\text{He} \rightarrow ^6\text{Li} + e^- +$ (2)
 - ii. $^{40}\text{K} \rightarrow \nu +$ (2)
- (c) Classify the following decays according to degree of forbiddenness:
- i. $^{89}\text{Sr}(\frac{5}{2}^+) \rightarrow ^{89}\text{Y}(\frac{1}{2}^-)$ (4)
 - ii. $^{36}\text{Cl}(2^+) \rightarrow ^{36}\text{Ar}(0^+)$ (4)
- (d) An even-Z, even-N nucleus has the following sequence of levels above its 0^+ ground state: 2^+ (89 keV), 4^+ (288 keV), 6^+ (585 keV), 0^+ (1050 keV), 2^+ (1129 keV). Draw an energy level diagram and show all reasonably probable γ transitions and their multipole assignments. (7)
