

**UNIVERSITY OF SWAZILAND**  
**FINAL EXAMINATION PAPER 2005**

**TITLE OF PAPER :      DEMOGRAPHIC METHODS**

**COURSE CODE    :      DEM 202**

**TIME ALLOWED   :      THREE (3) HOURS**

**INSTRUCTIONS    :      THIS PAPER HAS SEVEN QUESTIONS.  
ANSWER QUESTION 1 AND ANY FOUR (4)  
QUESTIONS.**

**PLEASE DO NOT OPEN THIS PAPER UNTIL PERMISSION HAS BEEN  
GRANTED BY THE INVIGILATOR**

### QUESTION 1 (COMPULSORY)

Select the most appropriate answer to the following and justify your choice.

- a. If the death rate of a stationary life table population is 10, this implies a life expectancy of about: (i) 65 years; (ii) 50 years; (iii) 100 years; (iv) 10 years
- b. The difference between a generation life table and a period life table is that: (i) the radix is different; (ii) one refers to a true birth cohort and the other does not; (iii) one uses a different method for calculating  $q_x$  than the other; (iv) none of the above.
- c. The life table mortality rates ( $q_x$ ) are usually (i) about the same as age specific death rates ( $m_x$ ); (ii) higher than  $m_x$ ; (iii) exactly the same values as  $m_x$ ; (iv) lower than  $m_x$ .
- d. If a country A has a higher life expectancy than country B, but A has a higher CDR, it is likely that: (i) A's population is younger than that of B; (ii) A's population is older than that of B; (iii) A's population has a high IMR; (iv) none of the above is probable.
- e. In a country with a high life expectancy, the fact that the actual death rate is lower than the death rate of the stationary population means that: (i) the actual population is growing through natural increase; (ii) the country has a younger actual population than the stationary population; (iii) neither of the above is true; (iv) both i and ii are true.
- f. A crude rate of natural increase of 30 per thousand leads to a doubling time of the population in approximately: (i) 15 years; (ii) 25 years; (iii) 50 years; (iv) 75 years
- g. Typically, age specific fertility rates for women: (i) are highest at ages 15-24 and lower thereafter; (ii) are highest at ages 20-29 and lower at ages 15-19 and at ages over 30; (iii) are highest at ages 25-34 and lowest at ages 15-24 and ages over 35; (iv) are fairly constant throughout the childbearing years.
- h. As compared with developing nations, the age structures of the developed nations tend to be unusually favorable to: (i) high CBR and CDR; (ii) low CBR and high CDR; (iii) low CBR and low CDR; (iv) high CBR and low CDR
- i. The net reproduction rate is a measure of the: (i) annual excess of births over deaths; (ii) annual rate at which women are replacing themselves on the basis of prevailing fertility and mortality, assuming no migration; (iii) decennial growth rate of the population; (iv) per generation growth rate assuming current age specific and mortality rates and no net migration; (v) none of the above

- j. The chief difficulty with the net reproduction rate as a predictive device for population growth is that it: (i) excludes the influence of fertility; (ii) makes inadequate allowance for mortality; (iii) is based on the rates of a single year; (iv) overlooks the type of culture possessed by the population; (v) only includes survivors of births in some past period.

(2 x10 =20 marks)

### QUESTION 2

- a. What is the purpose of standardizing rates? Suppose you were given the choice, which type of standardization do you prefer and why? (6 marks)
- b. Calculate the directly standardized death rates, U.S. and Mexico in 1980 from the following data. Comment on your results. (14 marks)

Ages	Mexico Population	Mexico Deaths	US Population	US Deaths
0-14	34,640,000	151,900	49,900,000	64,400
15-44	30,900,000	87,800	105,810,000	157,700
45-64	7,020,000	78,550	43,220,000	425,300
65+	2,440,000	149,150	26,070,000	1,341,800

### QUESTION 3

Distinguish fully between the following measures:

- rate of natural increase and intrinsic growth rate;
- stationary and stable population;
- life expectancy at birth and lifespan;
- migration stream and return migration;
- generation life tables and conventional life tables

(4x5 =20marks)

### QUESTION 4

Using the information given in Table 1 below:

- Calculate the in- and out-migration rates for all regions. (12 marks)
- Calculate the inter-regional migration rate. (4 marks)

- c. Use the results obtained above to discuss the migration pattern in Swaziland in 1966. **(4 marks)**

Table 1: African Population Born in Swaziland by Region of Birth and Region of Enumeration, 1966

Region of Enumeration	<u>Region of Birth</u>			
	Hhohho	Manzini	Shiselweni	Lubombo
Hhohho	72732	6301	3142	1482
Manzini	6340	72962	7406	2635
Shiselweni	652	1647	87316	732
Lubombo	3779	5372	6843	52098

### QUESTION 5

Complete the following life table for Zambia, 1985: **(8 marks)**

Partial Life Table for Zambia, 1982

Age	$q_x$	$l_x$	$nd_x$	$nL_x$	$T_x$	$e_x$
0-1	0.02593	100,000		97815	6989030	69.89
1-4		97407	409	388649		
5-9	0.00240	96998	233		6502566	67.04
10-14	0.00221		214	483342	6018205	
15-19	0.00456	96551	440	481746		57.33

Use this life table to answer the following questions:

- What is the likelihood that a child in Zambia will survive to age 10?  
**(4 marks)**
- Calculate the percentage of children aged 5-9 who will be alive when they are 15-19 years. **(4 marks)**
- Compute the crude death rate. **(4 marks)**

**QUESTION 6**

Describe fully the following:

- a. Life table as a stationary population and meanings of the columns of the life table.
- b. Uses of life tables.
- c. Net reproduction rate vs. replacement ratio.
- d. Assumptions made in the construction of a life table.

**(8+4+4+4=20 marks).**

**QUESTION 7**

Table A: Age Specific fertility rates (ASFR) for Swaziland: 1986.

<u>Age Group</u>	<u>Number of Women</u>	<u>ASFR</u>
15-19	77 844	0.0825
20-24	64 760	0.1931
25-29	53 464	0.1905
30-34	40 074	0.1714
35-39	34 193	0.1260
40-44	26 600	0.0655
45-49	24 364	0.0361

NB. Sex ratio at birth=105.

Based on Table A, compute the following measures and interpret them:

- a. General fertility rate.
- b. Total fertility rate.
- c. Gross reproduction rate.
- d. Age at maternity.

**(5x4=20 marks)**
