UNIVERSITY OF SWAZILAND

FINAL EXAMINATION PAPER 2011

TITLE OF PAPER	:	DESIGN AND ANALYSIS OF EXPERIMENTS
COURSE CODE	:	ST404
TIME ALLOWED	:	TWO (2) HOURS
REQUIREMENTS	:	CALCULATOR AND STATISTICAL TABLES
INSTRUCTIONS	:	ANSWER ANY THREE QUESTIONS

Question 1 **[20 marks, 2+4+8+6]**

In an industrial experiment, 5 batches of metal ingots were selected at random from the output of a production process; each batch contained 4 ingots. Different amounts of cadmium (*Cd*) and tin (*Sn*) were used in five treatments, as follows.

A	10% *Cd*	No *Sn*
B	20% *Cd*	No *Sn*
C	30% *Cd*	No *Sn*
D	10% *Cd*	10% *Sn*
E	30% *Cd*	10% *Sn*

Each ingot was melted and mixed with the appropriate amount of *Cd* and *Sn* and then allowed to cool. When the treated ingot was reheated, its melting point y (^{o}C) was recorded, as shown below.

Batch 1	A: 194	D: 205	E: 250	B: 214
Batch 2	B: 204	E: 243	D: 198	C: 238
Batch 3	D: 206	B: 205	C: 238	A: 186
Batch 4	A: 183	E: 247	B: 202	C: 229
Batch 5	E: 255	C: 244	D: 209	A: 198

(a) Explain fully the circumstances in which a balanced incomplete block design is appropriate. In the usual notation let v represent the number of treatments, b the number of blocks, r the number of replicates of each treatment and k the number of units in each block. Also let λ denote the number of times each pair of treatments occurs together in a block.

(b) State the values of v, b, r, k and λ in the above design.

(c) Obtain the analysis of variance for the data. State briefly your conclusions from this.

(d) Estimate the adjusted treatment means, compare these means and interpret your results.

Question 2 **[20 marks, 3+3+4+3+3+4]**

(a) The following table represents the treatment means from a 2×2 factorial experiment.

A	B: b_1	B: b_2
a_1	4	8
a_2	6	8

(i) What are the main effects of A?

(ii) What is the interaction effect?

(b) In order to test the null hypothesis that a randomly chosen coin from my pocket is properly balanced (so that it comes up heads or tails with equal probability), I toss the coin 5 times and obtain 5 heads. What is the p-value associated with my null hypothesis?

(c) Thirty trainees are randomly divided into three groups of 10 and each group is given instruction in the use of a different word-processing system. At the end of the training period, each trainee is given the same "benchmark" word-processing project to complete and the time required for completion is recorded. An ANOVA model will be used to test whether or not the mean time is the same for the three systems.

(i) What is the response variable here?

(ii) Identify the factor studies and the factor levels.

(iii) Is the factor experimental or a classification factor? Would the answer be different if each trainee had been allowed to select the word-processing system of his or her choice?

Question 3 [20 marks, 4+10+6]

An experiment is to be conducted involving five treatments A E, and there are enough units available to replicate each treatment five times. However, the experimenter can only deal with five units each day and therefore intends to spend five days on the experiment. There may be systematic differences between days, and also differences due to the order in which treatments are carried out each day

The experiment is finally carried out using the following plan, which also shows the measurement y obtained from each unit.

Order	Day 1	Day 2	Day 3	Day 4	Day 5
First	E: 8.21	D: 5.64	A: 6.52	B: 8.80	C: 6.18
Second	B: 8.55	E: 9.12	C: 5.97	D: 6.63	A: 6.96
Third	D: 6.06	A: 7.37	E: 8.58	C: 6.11	B: 8.95
Fourth	C: 6.34	B: 8.82	D: 6.70	A: 6.85	E: 8.87
Fifth	A: 7.89	C: 6.84	B: 9.03	E: 9.31	D: 6.85

(a) Explain briefly how you might attempt to check whether the assumptions required for an analysis of variance are satisfied.

(b) Construct the analysis of variance for these data.

(c) Find a 95% confidence interval for the difference between the means, $\bar{y}$, for treatments D and E.

Question 4 [20 marks, 8+8+4]

(a) A scientist believes that the concentration of a chemical in the root cells of a particular species of plant is linearly related to the quantity of an added soil nutrient. An experiment has been carried out using a completely randomised design, with four equally spaced levels of the nutrient and three varieties of the plant species. Two replicates were made, giving 24 observations altogether. The totals of the two replicates were as follows.

	Nutrient Level			
Variety	1	2	3	4
X	34	39	44	38
Y	26	37	41	35
Z	27	24	41	48

The sum of the squares of the 24 observations was 8202. Construct an analysis of variance. Assume no interaction between nutrient level and variety.

(b) A summary of the numbers of patrons who responded to an advertised promotion in four beauty salons of a small chain of beauty salons on five randomly selected days are given in table 1. Test at the 0.05 level of significance the null hypothesis that the four beauty salons have the same number of responses to the advertised promotion.

Table 1: Sample parameters for the four beauty salons

Salon	Sample mean	Sample variance
1	76	31.5
2	73	32.5
3	78	81.0
4	68	19.5

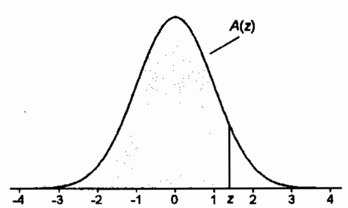
(c) In an experimental study of the efficacy of treatments for depression, patients attending a clinic were allocated at random to one of a number different drug treatments and other therapies. The response measurement was the decrease in Hamilton Rating Depression Score (HRDS) over a three month course of treatment. The data recorded are tabulated below; entries in the rows of the table are the decrease in HRDS for each treatment. The final group was treated using an inactive treatment (or placebo).

Group					
Therapy 1	5.20	3.65	7.03	5.63	4.57
Therapy 2	7.05	7.91	1.46	4.11	4.18
Drug A	4.71	3.75	2.85	4.89	6.09
Drug B	6.82	6.77	8.31	6.57	6.55
Placebo	5.13	6.07	3.55	5.69	3.97

What kind of design is being used in this study? Identify the *factor* being investigated, and for each factor state the number of levels that that factor has. Is the study *balanced*? Is it *complete*? Justify your answers.

Table A.1

Cumulative Standardized Normal Distribution



$A(z)$ is the integral of the standardized normal distribution from $-\infty$ to z (in other words, the area under the curve to the left of z). It gives the probability of a normal random variable not being more than z standard deviations above its mean. Values of z of particular importance:

z	$A(z)$	
1.645	0.9500	Lower limit of right 5% tail
1.960	0.9750	Lower limit of right 2.5% tail
2.326	0.9900	Lower limit of right 1% tail
2.576	0.9950	Lower limit of right 0.5% tail
3.090	0.9990	Lower limit of right 0.1% tail
3.291	0.9995	Lower limit of right 0.05% tail

z	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
0.0	0.5000	0.5040	0.5080	0.5120	0.5160	0.5199	0.5239	0.5279	0.5319	0.5359

Percentage Points of the t-Distribution

This table gives the percentage points $t_\nu(P)$ for various values of P and degrees of freedom ν, as indicated by the figure to the right.

The lower percentage points are given by symmetry as $-t_\nu(P)$, and the probability that $|t| \geq t_\nu(P)$ is $2P/100$.

The limiting distribution of t as $\nu \to \infty$ is the normal distribution with zero mean and unit variance.

	Percentage points P

Percentage Points of the χ^2-Distribution

This table gives the percentage points $\chi^2_\nu(P)$ for various values of P and degrees of freedom ν, as indicated by the figure to the right.

If X is a variable distributed as χ^2 with ν degrees of freedom, $P/100$ is the probability that $X \geq \chi^2_\nu(P)$.

For $\nu > 100$, $\sqrt{2X}$ is approximately normally distributed with mean $\sqrt{2\nu - 1}$ and unit variance.

5 Percent Points of the F-Distribution

This table gives the percentage points $F_{\nu_1,\nu_2}(P)$ for $P = 0.05$ and degrees of freedom ν_1, ν_2, as indicated by the figure to the right.

The lower percentage points, that is the values $F'_{\nu_1,\nu_2}(P)$ such that the probability that $F \leq F'_{\nu_1,\nu_2}(P)$ is equal to $P/100$, may be found using the formula

$$F'_{\nu_1,\nu_2}(P) = 1/F_{\nu_1,\nu_2}(P)$$

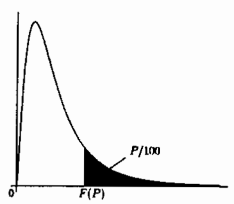
10 Percent Points of the F-Distribution

This table gives the percentage points $F_{\nu_1,\nu_2}(P)$ for $P = 0.10$ and degrees of freedom ν_1, ν_2, as indicated by the figure to the right.

The lower percentage points, that is the values $F'_{\nu_1,\nu_2}(P)$ such that the probability that $F \le F'_{\nu_1,\nu_2}(P)$ is equal to $P/100$, may be found using the formula

$$F'_{\nu_1,\nu_2}(P) = 1/F_{\nu_1,\nu_2}(P)$$



ν_2 \ ν_1	1	2	3	4	5	6	12	24	∞
