UNIVERSITY OF SWAZILAND

FINAL EXAMINATION PAPER 2011

TITLE OF PAPER	:	NONPARAMETRIC ANALYSIS
COURSE CODE	:	ST409
TIME ALLOWED	:	TWO (2) HOURS
REQUIREMENTS	:	CALCULATOR AND STATISTICAL TABLES
INSTRUCTIONS	:	ANSWER ANY THREE QUESTIONS

Question 1 [20 marks, 10+10]

(a) In an attempt to assess the effectiveness of a political candidate's campaign oratory, a group of 60 subjects were asked the question prior to and after a prepared speech by the candidate, "If the election were held right now, would you vote for Candidate X against the incumbent?" The results are as follows:

	After	
Before	-	+
+	2	25
-	20	13

Are the responses before and after the speech associated? Use $\alpha = 0.05$.

(b) The following data are the annual incomes (in thousands of emalangeni) for a random sample of $n = 10$ adults from a certain area

12.8, 13.6, 14.7, 16.2, 17.9, 18.6, 19.2, 19.8, 20.3, 24.4

Use the *sign* test to test that the median income doesn't exceed SZL20000 in this particular area. Use the exact null distribution of your test statistic to determine the critical value. Report your conclusions.

Question 2 [20 marks, 10+10]

(a) In a survey conducted in 1992, senior high school students were asked if they had ever used marijuana. Of the females sampled, 445 said yes and 675 said no; of the males sampled, 515 said yes and 641 said no. Are male high school students more likely to use marijuana?

(b) It is desired to design a given automobile to allow enough headroom to accommodate comfortably all but the tallest 5% of the people who drive. Former studies indicate that the 95^{th} percentile was 70.3 inches. In order to see if the former studies are still valid, a random sample of size 100 is selected. It is found that the 12 tallest persons in the sample have the following heights.

`72.6,70.0,71.3,70.5,70.8,76.0,70.1,72.5,71.1,70.6,71.9,72.8`

Is it reasonable to use 70.3 as the 95^{th} percentile.

Question 3 [20 marks, 8+12]

(a) Find the exact distribution of the Wilcoxon Signed Rank statistic for $n = 4$.

(b) The following data give the stroke index for 7 patients before and after treatment. We wish to test the hypothesis that the treatment has no effect.

Before	109	57	53	57	68	72	51
After	56	44	55	40	62	46	48

Use an appropriate test to see if the treatment has no effect. Use a 5% significance level. State the hypothesis, define the critical region(s) and conclusion. Also derive a 95% confidence interval for the median difference. Show all calculations.

Question 4 [20 marks, 10+10]

(a) The following data, arising from independent runs of a particular experiment, are a sample of $n = 10$ proportions:

0.012, 0.020, 0.076, 0.090, 0.179, 0.187, 0.190, 0.328, 0.622, 0.764.

Use an appropriate test to assess at the 10% significance level whether these data can be regarded as being sampled from a distribution having *cdf*

$$F_X(x) = 1 - (1 - x)^3, \qquad 0 < x < 1.$$

(b) In a diet test, each of four diet programs is applied to a sample of people. At the end of three weeks, the amount of pounds people lost are shown below.

Diet Program			
1	2	3	4
12	19	16	28
6	10	20	17
18	13	26	22
23	20	19	16
25	20		

Test to determine if there is enough evidence at the 5% significance level to infer that at least two population locations differ.

Question 5 [20 marks, 10+10]

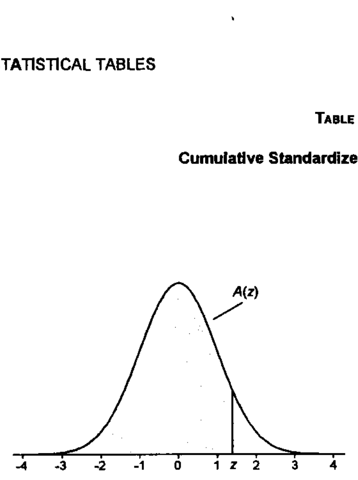
(a) An experimentor was involved in a study to determine if there is an association between stress and mental health. The Hopkins Symptom Checklist was used to determine the level of symptoms experiences and a scale was developed to measure stress levels. For data obtained, refer to the following table. Use **Kendall's tau** to perform the appropriate test at the 1% level of significance.

Participant	**Stress (X)**	**Symptoms (Y)**
1	33	100
2	30	92
3	11	83
4	18	69
5	5	98
6	16	105
7	3	65
8	21	84
9	21	70
10	35	120

(b) On 20 successive trips between Manzini and Mbabane a bus carried 24, 19, 32, 28, 21, 23, 26, 17, 20, 28, 30, 24, 13, 35, 26, 21, 19, 29, 27, and 23 passengers. Test whether it is reasonable to treat these data as if they constitute a random sample at $\alpha = 0.01$.

TABLE A.1

Cumulative Standardized Normal Distribution



$A(z)$ is the integral of the standardized normal distribution from $-\infty$ to z (in other words, the area under the curve to the left of z). It gives the probability of a normal random variable not being more than z standard deviations above its mean. Values of z of particular importance:

z	$A(z)$	
1.645	0.9500	Lower limit of right 5% tail
1.960	0.9750	Lower limit of right 2.5% tail
2.326	0.9900	Lower limit of right 1% tail
2.576	0.9950	Lower limit of right 0.5% tail
3.090	0.9990	Lower limit of right 0.1% tail
3.291	0.9995	Lower limit of right 0.05% tail

z	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09
0.0	0.5000	0.5040	0.5080	0.5120	0.5160	0.5199	0.5239	0.5279	0.5319	0.5359

Percentage Points of the χ^2-Distribution

This table gives the percentage points $\chi^2_\nu(P)$ for various values of P and degrees of freedom ν. as indicated by the figure to the right.

If X is a variable distributed as χ^2 with ν degrees of freedom, $P/100$ is the probability that $X \geq \chi^2_\nu(P)$.

For $\nu > 100$, $\sqrt{2X}$ is approximately normally distributed with mean $\sqrt{2\nu - 1}$ and unit variance.

	Percentage points P						
ν	10	5	2.5	1	0.5	0.1	0.05
1	2.706	3.841	5.024	6.635	7.879	10.828	12.116

Percentage Points of the Wilcoxon Signed Rank Distribution

This table gives the lower percentage points of W^+, the sum of the ranks of the positive observations in a ranking in order of increasing absolute magnitude of a random sample of size n from a continuous distribution which is symmetric about zero. The function tabulated $x(P)$ is the largest x such that $P(W^+ < x) \leq P/100$.

Upper Critical Values of Spearman's Rank Correlation Coefficient R_s

Note: In the table below, the critical values give significance levels as close as possible to but not exceeding the nominal α.

	Nominal α					
n	0.10	0.05	0.025	0.01	0.005	0.001
4	1.000	1.000	-	-	-	-
5	0.800	0.900	1.000	1.000	-	-
