# SUPPLEMENTARY EXAMINATION PAPER 2012

TITLE OF PAPER	:	QUANTITATIVE METHODS IN DEMOGRAPHY
COURSE CODE	:	DEM206
TIME ALLOWED	:	TWO (2) HOURS
REQUIREMENTS	:	CALCULATOR AND STATISTICAL TABLES
INSTRUCTIONS	:	ANSWER ANY THREE (3) QUESTIONS

1

.

## Question 1

# [20 marks, 5+5+5+5]

The length of human pregnancies is normally distributed with mean  $\mu = 266$  days and standard deviation  $\sigma = 16$  days.

- (a) What is the percentage of pregnancies that last more than 270days?
- (b) A "very preterm" baby is one where the gestation period is less than 244days. What proportion of births are "very preterm"?
- (c) Suppose an unusually long pregnancy is one that is in the top 2%. Determine the length of pregnancy that an separates unusually long pregnancy from one that is not unusually long.
- (d) Determine the length of pregnancy that would be considered typical if we define typical to be the middle 96% of pregnancies.

### **Question 2**

# [20 marks, 8+4+8]

- (a) A credit bureau conducts an analysis of 500 randomly selected time payment accounts of persons residing in Weston and finds that 45 of them were delinquent at one time or another. A similar study conducted in the town of Easton, where 600 randomly selected accounts were analyzed, finds 36 of the accounts were delinquent at one time or another. Use the level of significance  $\alpha = 0.05$  to determine whether the proportion of delinquencies in Weston is higher than in Easton.
- (b) Music Technologies, an electronics retail company in Durban has kept records of the number of ipods sold within a week of placing advertisements in the *Mercury*. The following table shows the number of ipods sold and the corresponding number of advertisements placed in the *Mercury* for 12 randomly selected weeks over the past year.

Ads	4	4	3	2	5	2	4	3	5	5	3	4
Sales	26	28	24	18	35	24	36	25	31	37	30	32

- (i) Estimate the linear regression line ( $\sum x = 44$ ,  $\sum y = 346$ ,  $\sum x^2 = 174$ ,  $\sum xy = 1324$  and  $\sum y^2 = 10336$ ).
- (ii) Is the *relationship* between the number of *newspaper advertisements* placed and *ipod sales* meaningful (or significant)? Use  $\alpha = 0.05$ .

### **Question 3**

# [20 marks, 10+10]

(a) Management at Woolworths' head office wanted to know whether the proportion of their credit card customers who pay for their purchases by *Mastercard credit card* varies across their three major retail outlets (that is, Canal Walk, Sandton Mall, Somerset Mall).

A random sample of 180 credit card purchases across the three retail outlets was selected and the number of Mastercard credit card transactions per store was recorded. Out of 52 credit card purchases in Canal Walk, 36 used a Mastercard credit card; out of 84 transaction in Sandton mall, 44 used the Mastercard; out of 44 transactions in Somerset Mall, the Mastercard was used 26 times. Use  $\alpha = 0.05$ .

(b) The production manager of Raylite batteries, a car battery manufacturer, wants to know whether the three machines used for this process (labelled A, B and C) produce equal amount of rejects. A random sample of shifts for each machine was selected and the number of rejects produced per shift was recorded.

Machine A	Machine B	Machine C
11	7	14
9	10	13
6	8	11
12	13	16
14		16
11		

### **Question 4**

## [20 marks, 10+5+5]

A short-stay car park in a shopping area has spaces marked out for 90 cars. A local councillor notices that there are always some vacant spaces. He puts forward a plan to create a garden and seating area using part of the car park. This would reduce the number of parking spaces to 78.

- (a) From a random sample of 14 users of the car park, 11 say that the car park will be too small if this plan is carried out. Carry out a test, at the 5% significance level, to determine whether more than half of the users of the car park think it will be too small.
- (b) The number of occupied spaces, x, in the car park is recorded on each of 16 randomly chosen occasions during shopping hours. The results may be summarised as follows:

$$\bar{x} = 59.9$$
  $s = 7.83$ 

Construct a 95% confidence interval for the mean,  $\mu$ , of the number of spaces occupied in the car park during shopping hours. Assume that the sample is drawn from a normal population.

(c) The councillor claims that the value of  $\mu$  is no more than 65. It is found that the number of occupied spaces during shopping hours is best modelled by a Poisson distribution with mean  $\mu$ . Taking  $\mu$  to be 65, use a distributional approximation to find the probability that more than 78 spaces are occupied in the car park at any one time.

## **Question 5**

# [20 marks, 10+6+4]

Students on an environmental science course are investigating nitrate pollution in a river in an agricultural region. The level of pollution becomes a cause for concern when the mean concentration of nitrate exceeds 30 milligrams per litre of water.

The river is divided into a large number of sections of equal length.

(a) One student takes samples of water at 8 randomly chosen locations along one of these sections and analyses the samples for nitrate concentration. Her results, in milligrams of nitrate per litre of water, are

30 34 34 37 28 30 34 35

Carry out a test to investigate whether the nitrate pollution in this section of the river is a cause for concern. Assume that the data are drawn from a normal population, and use the 1% significance level.

- (b) The students carry out similar investigations to that in part (i) on 42 sections. Their tests indicate that the mean concentration of nitrate exceeds 30 milligrams per litre of water in 16 sections.
  - (i) Carry out a test, at the 1% significance level, to determine whether the level of nitrate concentration is a cause for concern in less than 60 per cent of sections of this river.
  - (ii) Construct the 95% confidence interval for the proportion of sections which are not polluted.

#### Percentage Points of the t-Distribution

This table gives the percentage points  $t_{\nu}(P)$  for various values of P and degrees of freedom  $\nu$ , as indicated by the figure to the right. The lower percentage points are given

by symmetry as  $-t_{\nu}(P)$ , and the probability that  $|t| \ge t_{\nu}(P)$  is 2P/100. The limiting distribution of t as  $\nu \to \infty$ 

is the normal distribution with zero mean and unit variance.
