UNIVERSITY OF SWAZILAND

MAIN EXAMINATION 2013/14

TITLE OF PAPER: DEMOGRAPHIC METHODS

CORSE NUMBER: DEM 202

TIME ALLOWED: 3 HOURS

INSTRUCTIONS: ANSWER OUESTION 1 AND 2 AND ANY TWO QUESTIONS FROM SECTION B. ALL QUESTIONS ARE WORTH 25 MARKS EACH.

REQUIREMENTS: CALCULATOR

THIS PAPER SHOULD NOT BE OPENED UNTIL PERMISSION HAS BEEN GIVEN BY THE INVIGILATOR

## SECTION A: COMPULSORY

## Question 1

a) Why is it necessary to decompose rates? (2)
b) Describe the two components that are computed when decomposing the difference between two populations' crude death rate. (6)
c) Using the statistics in the table below, calculate the following:
a. The CDR for the UK and Kuwait. (4)
b. The directly standardized death rate for Kuwait.(10)
c. Comment on your results. (3)

Table 1: Population and Deaths by age, UK and Kuwait, 1996
UK Kuwait

| Age group | Population | Deaths | Population | Deaths |
| :--- | :--- | :--- | :--- | :--- |
| $0-4$ | 3763438 | 6018 | 183169 | 620 |
| $5-14$ | 7594916 | 1207 | 329010 | 106 |
| $15-24$ | 7325068 | 4264 | 267584 | 181 |
| $25-44$ | 13223708 | 12849 | 765975 | 627 |
| $45-64$ | 13354266 | 92470 | 185232 | 967 |
| $65+$ | 9250797 | 514960 | 23011 | 1314 |

## Question 2

a) It is often said that women generally live longer than men. Discuss this statement. (10)
b) Someone proposes calculating an infant mortality rate using the number of births in a given calendar year $t$ in the denominator and the number of deaths of persons under age 1 in the same calendar year, $t$ in the numerator arguing this would better reflect the mortality experience of the birth cohort.
a) Why might this suggestion not work well in practice? (2)
b) Suggest a modification to the proposal which should lead to an infant mortality rate which better reflects the experience of the births occurring in year $t$. (4)
c) Given the following births and infant deaths recorded in Belgium, calculate:
I. The conventional infant mortality rate for 1968. (3)
II. The adjusted infant mortality rate for 1968 using the cohort method (3)
III. The adjusted infant mortality rate for 1968 using the additive method (3)

| Year | Birth Cohort | Age (yrs) | Deaths | Births |
| :--- | :--- | :--- | :--- | :--- |
| 1967 | 1967 | 0 | 2893 | 142471 |
| 1968 | 1967 | 0 | 481 | --- |
| 1968 | 1968 | 0 | 2603 | 138214 |
| 1969 | 1968 | 0 | 302 | ----- |

## SECTION B: ANSWER ANY TWO QUESTIONS

## Question 3

a) Distinguish between generation and abridged life tables. (4)
b) Using the life table below, compute the following life table indices showing clearly the notation and formulae used:

| i. | $\mathrm{l}_{10}$ | $(2)$ |
| ---: | :--- | ---: |
| ii. | $1_{0} \mathrm{~d}_{0}$ | $(2)$ |
| iii. | ${ }^{5} \mathrm{~L}_{5}$ | $(2)$ |
| iv. | $\mathrm{T}_{1}$ | $(2)$ |
| v. | $\mathrm{T}_{15}$ | $(2)$ |
| vi. | $\mathrm{e}_{15}$ | $(2)$ |

Table 3: Abridged life table for country A

|  | nge $\mathbf{q}_{\mathbf{x}}$ | $\mathbf{l}_{\mathbf{x}}$ | ${ }_{\mathbf{n}} \mathbf{d}_{\mathbf{x}}$ | $\mathbf{n}_{\mathbf{x}}$ | $\mathbf{T}_{\mathbf{x}}$ | $\mathbf{e}_{\mathbf{x}}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $0-1$ | 0.03168 | 100000 |  | 97782 | 6997475 | 69.97 |
| $1-4$ | 0.00793 | 96832 | 768 | 385793 |  |  |
| $5-9$ | 0.00344 | 96064 | 331 |  | 6513900 | 67.81 |
| $10-14$ | 0.00280 |  | 268 | 477998 | 6034406 | 63.03 |
| $15-19$ | 0.00444 | 95466 | 424 | 476269 |  |  |
| $20-24$ | 0.00613 | 95042 | 583 | 473752 | 5080139 | 53.45 |
| $25-29$ | 0.00747 | 94459 | 706 | 470531 | 4606386 | 48.77 |
| $30-34$ | 0.00911 | 93753 | 854 | 466632 | 4135855 | 44.11 |

c) Is a stationary population also a stable population? Explain your answer. (4)
d) At the start of the $21^{\text {st }}$ century, China had an estimated $\mathrm{R}_{0}$ of 0.81297 and an $\mathrm{R}_{1}$ of 23.52850. Calculate the population's intrinsic rate of natural increase and the mean length of a generation (5)

## Question 4

a) Why is the study of nuptiality of importance in demography? (6)
b) Using the data in Table 4 below, calculate the mean age at first marriage for males and females and give an interpretation of the results.(12)

Table 4: Number of people marrying for the first time by age and sex, England, 1991

| Age | Males | Females |
| :---: | :--- | :--- |
| $15-19$ | 4630 | 17704 |
| $20-24$ | 74378 | 103689 |
| $25-29$ | 91675 | 72523 |
| $30-34$ | 34560 | 21000 |
| $35-39$ | 10252 | 5785 |
| $40-44$ | 3998 | 2075 |
| $45-49$ | 1520 | 911 |

c) Using the data given below, calculate the singulate mean age at marriage for females in Sweden in 1945. Interpret your results.(7)

Table 5: Proportions of Females Never Married, Sweden, 1945

| Age group | \% single females |
| :--- | :--- |
| $15-19$ | 97.0 |
| $20-24$ | 63.6 |
| $25-29$ | 30.4 |
| $30-34$ | 20.4 |
| $35-39$ | 19.0 |
| $40-44$ | 20.4 |
| $45-49$ | 21.0 |
| $50-54$ | 21.0 |

## Question 5

a) Distinguish between lifetime migration and return migration (4)
b) Table 6 shows the numbers of males by age group recorded in the Barbados censuses of 1970 and 1980. It is assumed that the intercensal mortality
conditions are represented by the given life table values. Using the life table forward survival ratio method, calculate:
i. The number of net migrants for the age groups 15-19 and 35-39 in 1980. (6)
ii. The net intercensal migration rates for the above age groups. (6)

Table 6: Male Population and life table survivorship by age, Barbados, 1970 and 1980

| Male Population |  |  |  | Life table survivorship |  |  |
| :--- | :--- | :--- | :--- | :--- | :---: | :---: |
| Age group | $\mathbf{1 9 7 0}$ | $\mathbf{1 9 8 0}$ | Age $\mathbf{x}$ | $\mathbf{n}_{\mathbf{x}} \mathrm{L}_{\mathbf{x}}$ |  |  |
| $10-14$ | 14996 | 12859 | 10 | 479193 |  |  |
| $15-19$ | 12829 | 13642 | 15 | 477275 |  |  |
| $20-24$ | 9875 | 12382 | 20 | 474287 |  |  |
| $25-29$ | 5724 | 10001 | 25 | 470794 |  |  |
| $30-34$ | 4808 | 7724 | 30 | 467100 |  |  |
| $35-39$ | 4295 | 5019 | 35 | 462661 |  |  |
| $40-44$ | 4540 | 4379 | 40 | 456544 |  |  |
| $45-49$ | 4300 | 3862 | 45 | 447177 |  |  |

c) Using the data in Table 7, project the female population aged 0-4 for a hypothetical population using the component method.(9)

Table 7: Female Population by Age (1970 and 1975) and ASFR.

| Age | Base Year Female <br> Population | Projected Female <br> Population | ASFR |
| :--- | :--- | :--- | :--- |
| $15-19$ | 18200 | 20000 | 0.080 |
| $20-24$ | 18000 | 19300 | 0.100 |
| $25-29$ | 17800 | 18500 | 0.160 |
| $30-34$ | 17600 | 18200 | 0.080 |
| $35-39$ | 17400 | 18100 | 0.050 |
| $40-44$ | 17200 | 18000 | 0.030 |
| $45-49$ | 17000 | 17900 | 0.010 |

Additional information: ${ }_{5} \mathrm{~L}_{5} / 5 \mathrm{l}_{0}=0.97895$

## Question 6

a) If the crude birth rate in a country remains constant over a number of years but the general fertility rate increases steadily, what does this tell you about the country's population? (3)
b) Using the data in Table 8, below calculate the following:
i) ASFRs for age groups 15-19 and 25-29 (2)
ii) The total fertility rate (4)
iii) The Gross Reproduction Rate (3)
iv) The Net Reproduction Rate (6)

Table 8: Statistics for fertility calculation, Australia, 1996

| Age | Total births | Female <br> births | Total <br> women | Survival <br> Probability |
| :--- | :--- | :--- | :--- | :--- |
| $15-19$ | 12509 | 5988 | 621542 | 0.99175 |
| $20-24$ | 44837 | 21807 | 694273 | 0.98985 |
| $25-29$ | 82782 | 40278 | 709746 | 0.98792 |
| $30-34$ | 76435 | 37227 | 720453 | 0.98566 |
| $35-39$ | 31864 | 15359 | 727555 | 0.98261 |
| $40-44$ | 5113 | 2470 | 672182 | 0.97826 |
| $45-49$ | 128 | 61 | 640985 | 0.97152 |

c) Suppose a certain hypothetical birth cohort for women has the following parity progression ratios:
$\mathrm{P}_{1}=0.862$
$\mathrm{P}_{2}=0.804$
$\mathrm{P}_{3}=0.555$
$\mathrm{P}_{4}=0.518$
Assuming that no woman in this birth cohort had a fifth child, out of 1000 women calculate:
i) the number of women who remain childless (2)
ii) the number of women who have exactly one child? (2)
iii) the cohort total fertility rate (3)
