

UNIVERSITY OF SWAZILAND

MAIN EXAMINATION PAPER 2018

- TITLE OF PAPER :** **PROBABILITY THEORY II**
- COURSE CODE :** **STA 212**
- TIME ALLOWED :** **2 HOURS**
- INSTRUCTIONS :** **ANSWER ANY THREE QUESTIONS.**
- REQUIREMENTS :** **SCIENTIFIC CALCULATOR AND
STATISTICAL TABLES.**

Question 1

The joint probability mass function of the lifetimes X and Y of two connected components in a machine can be modelled by $p(x, y) = \frac{e^{-2}}{x!(y-x)!}$ for $x = 0, 1, \dots$ and $y = x, x+1, \dots$

- What is the marginal distributions of X and Y ?
- What is the joint probability mass function of X and $Y - X$? Are X and $Y - x$ independent?
- What is the correlation between X and Y ?

(7 + 7 + 6 Marks)

Question 2

The continuous random variables X and Y satisfy $f(y|x) = \frac{1}{x}$ for $0 < y < x$, and $f(y|x) = 0$ otherwise. The marginal density function of X is given by $f_X(x) = 2x$ for $0 < x < 1$ and $f_X(x) = 0$ otherwise.

- What is the conditional density? $f(x|y)$?
- What is $E(X|Y = y)$?

(10 + 10 Marks)

Question 3

- Let $X \sim N(\mu_1, \sigma_1^2)$, and $Y \sim N(\mu_2, \sigma_2^2)$. Furthermore X and Y are independent to each other. Derive the distribution of $2X - 3Y - 5$.
- A company insures homes in three cities J, K, L. The losses occurring in these cities are independent. The moment generating functions for the loss distributions of the cities are

$$M_J(t) = (1 - 2t)^{-3}, \quad M_K(t) = (1 - 2t)^{-2.5}, \quad M_L(t) = (1 - 2t)^{-4.5}$$

Let X represent the combined losses from the three cities. Calculate $E(X^3)$.

(10 + 10 Marks)

Question 4

- An insurance policy pays a total medical benefit consisting of a part paid to the surgeon, X , and a part paid to the hospital, Y , so that the total benefit is $X+Y$. Suppose that $\text{Var}(X) = E5,000$, $\text{Var}(Y) = E10,000$, and $\text{Var}(X + Y) = E17,000$.

If X is increased by a flat amount of E100, and Y is increased by 10%, what is the variance of the total benefit after these increases?

- Given that $E(X) = 5$, $E(X^2) = 27.4$, $E(Y) = 7$, $E(Y^2) = 51.4$, and $\text{Var}(X + Y) = 8$, find $\text{Cov}(X + Y, X + 1.2Y)$.

(10 + 10 Marks)

Question 5

- a) A diagnostic test for the presence of disease has two possible outcomes: 1 for disease present and 0 for disease not present. Let X denote the disease state of a patient, and let Y denote the outcome of a diagnostic test. The joint probability function of X and Y is given by:

$$P(X = x, Y = y) = \begin{cases} 0.800 & \text{for } (x, y) = (0, 0) \\ 0.050 & \text{for } (x, y) = (1, 0) \\ 0.025 & \text{for } (x, y) = (0, 1) \\ 0.125 & \text{for } (x, y) = (1, 1) \end{cases}$$

Calculate $\text{Var}(Y|X=1)$.

- b) The stock prices of two companies at the end of any given year are modeled with random variables X and Y that follow a distribution with joint density function

$$f(x, y) = \begin{cases} 2x & \text{for } 0 < x < 1, x < y < x + 1 \\ 0 & \text{otherwise} \end{cases}$$

What is the conditional variance of Y given that $X = x$?
